

GUARDIAN

Research Framework & Project Portfolio

Institutional digital assets, market infrastructure, regulation and macro-financial systems

Developed by Michael Torgeir Michailoff

Independent research programme, 2024-present | Palma de Mallorca, Spain

Purpose of this appendix

To explain the structure, research discipline and professional value of Guardian as a work sample for analyst and consulting roles. The document describes the framework and the work performed; it does not claim external endorsement by the institutions monitored or contacted.

July 2026

1. EXECUTIVE OVERVIEW

Guardian is a closed, version-controlled research framework for analysing the institutional development of digital assets and financial-market infrastructure. It converts a high-volume stream of regulatory publications, market-infrastructure announcements, banking developments and macro-financial signals into a fixed analytical map. The work began in 2024 and has been maintained as a full-time independent research programme.

The framework was built to solve five practical problems: prevent narrative drift, prevent double-counting, distinguish evidence from inference, make assumptions falsifiable, and show exactly which operational or regulatory gate remains open before an institutional outcome can occur.

Fixed architecture	144 canonical nodes; new evidence must map to an existing node
Analytical layer	15 active engines plus one integrated meta-anchor
Evidence controls	Source hierarchy, four filters, global deduplication and zero drift
Auditability	Batch number, date/time, signal ID, primary node and node effect recorded
Falsifiability	Explicit disconfirming conditions and deadline-based review clocks
Output	Dashboards, node-state changes, implementation gaps and concise institutional briefs

2. WHAT I BUILT

- A canonical node system that covers payment rails, clearing, tokenization, custody, regulation, prudential capital, collateral, market structure, macro stress and institutional onboarding.
- A disciplined integration process in which each signal receives one primary node and retains its identity across later updates.
- A source-quality model that distinguishes law, regulators, central banks, market infrastructure, companies, reputable media, participant testimony and unverified social claims.
- A protected-node structure that prevents indirect macro or thematic signals from being used to claim operational execution.
- A batch ledger for packaging every 50 new points into complete model updates for cross-model review.
- A banktrack module that records institutional conversations, onboarding gates, custody constraints and product-readiness indicators without treating relationship contact as product proof.

3. ARCHITECTURE

Layer	Coverage	Professional purpose
Infrastructure	Payments, DTCC/FICC, Swift, RTGS, DLT, tokenized securities, custody and APIs	Tracks whether technology is tested, live, interoperable and institutionally processable
Regulation	Basel/BCBS, SEC, CFTC, OCC, MiCA, FINMA, AML/CFT and legal classification	Separates legal permission from capital treatment, accounting, collateral parameters and execution
Banking & credit	Private banking, custody, prime brokerage, collateral, haircut, LTV and credit structuring	Maps the path from client classification to an executable institutional product
Market structure	Liquidity, derivatives, ETFs, OTC, stablecoins, tokenized assets and volatility	Evaluates market maturity and the difference between tradability and institutional scale
Macro-financial	Sovereign debt, refinancing, energy, inflation, funding stress and geopolitics	Provides scenario pressure without allowing macro stress to masquerade as product evidence
Framework operations	Protected nodes, model lock, visible thresholds, banktrack and execution gap	Maintains auditability and identifies the exact unresolved implementation gate

4. ANALYTICAL ENGINES

Guardian uses established theories and standards as interpretive frameworks rather than as independent evidence. The engine layer includes:

Valuation & network: Metcalfe, Fisher velocity, float scarcity and deterministic supply mechanics

Collateral & monetary: Gresham, Holmström/Gorton, Triffin and Keynesian liquidity preference

Regulatory & infrastructure: BCBS/SCO60, OCC custody guidance, BIS/CPMI settlement and regulatory arbitrage

Behavioural & strategic: Nash equilibrium, Spence signalling, first-mover advantage and Rogers diffusion

Meta-anchor: Information insensitivity integrated across collateral, capital regulation and settlement

5. EVIDENCE, DEDUPLICATION & FALSIFICATION

Every new item passes through four controls before it can change the model:

Filter 1 - Source quality - Classifies official institutions, regulated market infrastructure, corporate disclosures, reputable media, participant testimony and unverified claims.

Filter 2 - Global deduplication - One signal maps to one primary node. Later repetitions can improve evidence quality but cannot create multiple percentage effects.

Filter 3 - Zero drift - No new nodes, titles or engines may be created to accommodate a preferred narrative.

Filter 4 - Effect discipline - Signals receive controlled labels such as strengthened, watch, counter-signal, duplicate, quarantine, weakened or falsified.

6. DAILY RESEARCH WORKFLOW

1. Capture	Collect primary publications, market-infrastructure updates, regulation, bank disclosures and material market events.
2. Verify	Confirm source identity, publication date, exact wording, scope and whether the information is primary, secondary or testimonial.
3. Deduplicate	Check the global signal ledger and saturated clusters before assigning any model effect.
4. Map	Assign the exact canonical node, record date/time and preserve the signal ID.
5. Interpret	Separate verified fact, source quality, Guardian inference, structural meaning and remaining implementation gap.
6. Falsify	Search for counter-evidence and determine whether a previous state should be retained, weakened or falsified.
7. Report	Produce a concise dashboard and append the full chain to the internal ledger.

7. INSTITUTIONAL ENGAGEMENT

Alongside the research framework, I developed and presented an institutional custody, collateral and philanthropic-banking case to European financial institutions. The objective was to test real-world onboarding, governance, custody and credit constraints against the model.

- Held exploratory discussions with senior representatives at private banks, regulated digital-asset banks and custody providers.
- Documented qualified-investor thresholds, onboarding processes, market-value requirements, custody capabilities and relationship-management pathways.
- Used the feedback as participant testimony and process evidence - never as proof that a product, asset treatment or future institutional decision had been approved.
- Built a chronological banktrack ledger to identify recurring patterns: senior recognition, internal review, process friction, eligibility thresholds and delayed execution.

8. PROFESSIONAL VALUE

Guardian demonstrates the following capabilities relevant to analyst and consulting roles:

- High-volume research synthesis without losing source attribution or chronology.
- Ability to distinguish infrastructure readiness, legal permission, capital treatment and actual execution.
- Strong pattern recognition combined with explicit counter-signal and falsification controls.
- Comfort working across regulation, technology, banking, macroeconomics and market structure.
- Clear communication of complex systems to both technical and non-technical audiences.
- Long-duration independent project ownership, documentation discipline and version control.

9. SAMPLE OUTPUT STRUCTURE

Each update records: version and dashboard; date/time and source; source quality; exact canonical node; controlled node effect; structural interpretation; and the resulting model delta. This creates a concise front-end while preserving the full evidence chain in the internal ledger.

Best-fit roles: Digital Assets Research Analyst | Tokenization / Market Infrastructure Analyst | Regulatory Intelligence Analyst | Research Associate | Independent Research Consultant
